

Workshop: Blog

The 2000s called and said that blogging is back! You like to keep up with the trends and decide to create your own blog.

Knowing some of the **best practices** for building an app that uses a database, start working on the project. Below are the images, which demonstrate how the app should look like. The needed entities are described below as well. Keep in mind that all of the properties are **required**.

It's up to you to decide what approach to use. Don't forget what a blog's functionalities are:

- You can **register/login/logout**;
- You can **see all** of the posted articles and check their details;
- You can **edit** and **delete only** the articles that **you** have **created**.

Feel free to implement whatever patterns you feel most comfortable with. If you want, you can add some other functionalities.

1. Entities

Article

- **Id** (**int**, primary key)
- **Title** (**string** with length [10...50])
- **Content** (**string** with length [50...1500])
- **CreatedOn** (**DateTime**)
- **Author** (**string**)

ApplicationUser

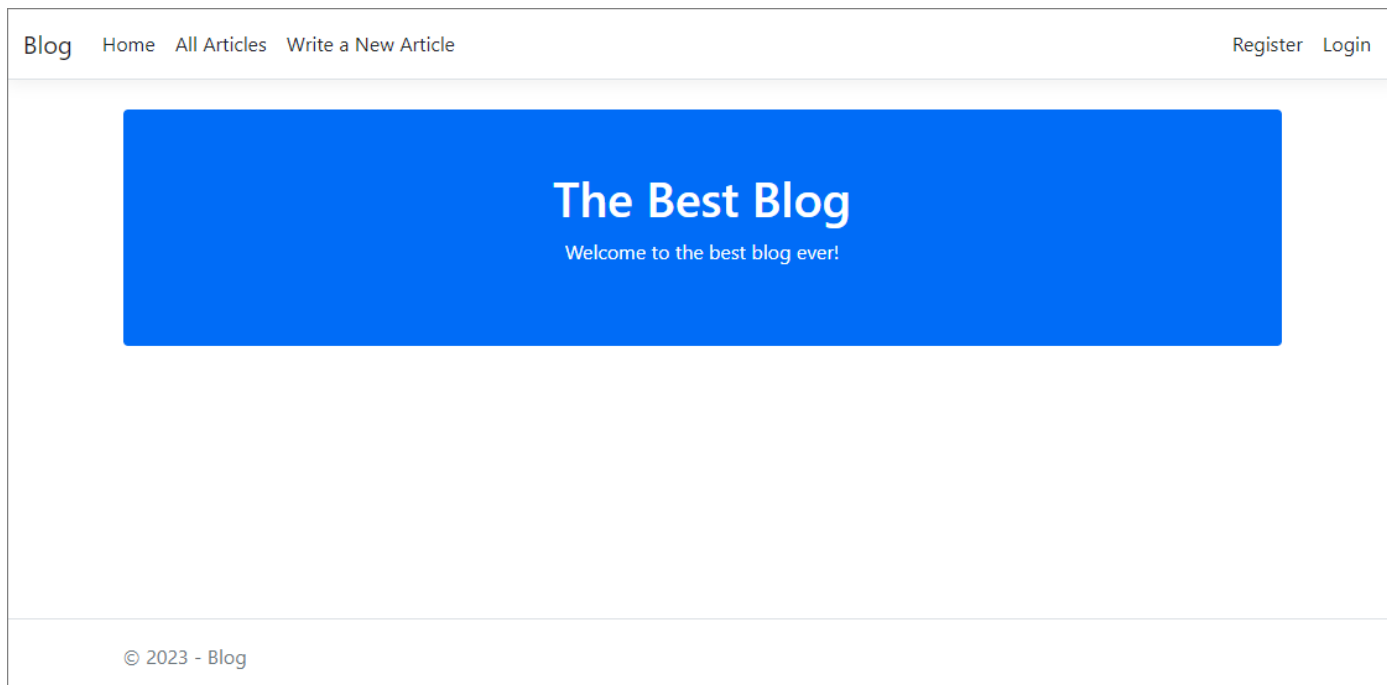

- **Id** (**string**, primary key)
- **UserName** (**string** with length [5...20])
- **Email** (**string** with length [10...50])
- **Email** (**string** with length [5...20])

2. Pages

If you are having trouble with the view files, you can use the ones from the Resources.

Home

This what the "Home" Page should look like.

Add Article

This is how the "Create a New Article" Page should look like.

A screenshot of a web application's 'Create a New Article' page. The navigation bar at the top is identical to the homepage, but the right side shows 'Hello User!' and 'Logout' instead of 'Register' and 'Login'. The main content area has a title 'Create a New Article' centered at the top. Below the title, there are three input fields: 'Title', 'Content', and 'Genre'. The 'Genre' field contains the text 'Fun'. Below these fields is a blue button labeled 'Add'. At the bottom of the page, a footer bar contains the text '© 2023 - Blog'.

All Articles

This is how you should visualize the list of articles.

3. Functionality

The app users should be able to view all of the articles, add new ones, delete and edit only created by them articles. If you want, you can try to implement some other functionalities.

Happy Coding! 😊
